<h2>优点?</h2>

<p>支持单表操作,两张表联查操作,不支持于两张表操作</p>

<p>1.支持多种语句操作,如eq,ne,ge,gt,le,lt,is null,not null,is empty,not empty,in,not in,以上操作为AND,目前不支持OR</p>

<p>2.支持两张表联查,依旧不写sql,同时也支持以上多种操作符。只需要简单配置一下注解即可。</p>

<p>3.支持字段别名,cas需求就很好处理了哦。对同一个字段可以取别名多次set。</p>

<p>4.有工具类,直接生成数据库建表文件,对象建模。</p>

<h2>缺点?</h2>

<p>目前id方案不支持数据库自增,采取编码set d的方案,后续会实现id生成器。</p>

<p>没实现oracle。。。只实现了mysql数据支持。</p>

<h2>使用方式</h2>

<p>参考如下几个实现类
1.QueryBuilder 实现查询业务
2.UpdateBuilder 实现更新业务支持根据查询条件更新数据
3.InsertBuilder 实现插入业务
4.DeleteBuilder 实现删除业</p>

<h2>准备开始</h2>

<p>定义领域对象</p>

<div class="white">

<div class="highlight">

```
<pre class="brush: java">@Alias("user_info")
```

```
@Table(table = "user_info")
```

```
public class UserInfo extends BasicModel<UserInfo> {
```

```
    @Column(length = "200", desc = "用户头像")
```

```
    private String poster;
```

```
@Column(length = "50")
```

```
private String nickname;
```

```
//省略get/set
```

```
}
```

```
</pre>
```

```
</div>
```

```
</div>
```

<p>mybatis配置文件扫描领域对象,如想使用mybatis的扫描机制,切记数据库字段和对象字段要一致,不一致请到xml里面去配置映射关系,目前没找到其他实现方式,下一版本直接在mybatis源码扩展功能,量改动源码。</p>

<div class="white">

<div class="highlight">

```
<pre class="brush: xml">&lt;?xml version="1.0" encoding="UTF-8" ?&gt;
```

```
&lt;!DOCTYPE configuration PUBLIC "-//mybatis.org//DTD Config 3.0//EN"
```

```
"http://mybatis.org/dtd/mybatis-3-config.dtd"&gt;
```

```
&lt;configuration&gt;
```

```

    <typeAliases>
        <package name="com.xxx.model"/>
    </typeAliases>
</configuration></pre>
</div>
</div>
<p>定义一个mapper,不需要实现方法,泛型指定返回对象</p>
<div class="white">
<div class="highlight">
<pre class="brush: java">public interface UserInfoMapper extends MyBaseMapper<UserInfo> {}
</pre>
</div>
</div>
<p>定义一个dao接口</p>
<div class="white">
<div class="highlight">
<pre>public interface UserInfoDao extends MyBaseDao<UserInfo> {}
</pre>
</div>
</div>
<p>实现dao,对mapper进行绑定,指定mapper的class,dao也可以用传统的xml方式实现自己的业务,do绑定mapper为了调用mapper通用方法,也还原了大家经常使用mybatis的方式。 </p>
<div class="white">
<div class="highlight">
<pre class="brush: java">@Repository
public class UserInfoDaoImpl extends AbstractMySqlBaseDao<UserInfo> implements UserInfoDao {
    @Override
    public Class mapperClass() {
        return UserInfoMapper.class;
    }
}
</pre>
</div>
</div>
</div>
<p>spring配置里面加入如下,com.xxxx.mapper为项目定义mapper目录</p>
<div class="white">
<div class="highlight">
<pre class="brush: xml"> <bean class="org.mybatis.spring.mapper.MapperScannerConfigurer">
    <property name="basePackage" value="com.xxxx.mapper"/>
    <property name="sqlSessionFactoryBeanName" value="sqlSessionFactory"/>
</bean>

```

```

<!-- myBatis Sql映射文件 -->
<bean id="sqlSessionFactory" class="org.mybatis.spring.SqlSessionFactoryBean">
<property name="dataSource" ref="multipleDataSource"/>
<property name="configLocation">
<value>classpath:mapper/entity-config.xml<
value>

```

</property>

<!--

依旧可以使用mybatis配置文件方式

<property name="mapperLocations" value="classpath*:mapper/*.xml"/>

-->

</bean>

</pre>

</div>

</div>

<h2>开始使用</h2>

<p>注意:所有property字符串都为java类字段定义,非数据库字段。</p>

<p>查询单个对象</p>

<div class="white">

<div class="highlight">

```
QueryBuilder queryBuilder = QueryBuilder.build(UserInfo.class).eq("d",1);
```

```
UserInfo userInfo = userInfoDao.one(queryBuilder);
```

</pre>

</div>

</div>

<p>查询list</p>

<div class="white">

<div class="highlight">

```
QueryBuilder queryBuilder = QueryBuilder.build(UserInfo.class).eq("tatus",1);
```

```
List<UserInfo> userInfos = userInfoDao.list(queryBuilder);
```

</pre>

</div>

</div>

<p>查询总数</p>

<div class="white">

<div class="highlight">

```
QueryBuilder queryBuilder = QueryBuilder.build(UserInfo.class).eq("tatus",1);
```

```
int count = userInfoDao.count(queryBuilder);
```

</pre>

</div>

</div>

<p>查询当前页数据</p>

<div class="white">

<div class="highlight">

```
QueryBuilder queryBuilder = QueryBuilder.build(UserInfo.class).page(1).size(10).eq("status",1);
```

```
PageData page = userInfoDao.page(queryBuilder);
```

</pre>

</div>

</div>

<p>更新数据</p>

<div class="white">

```
<div class="highlight" >
<pre class="brush: java">UpdateBuilder update = UpdateBuilder.build(UserInfo.class).set("last_login_time",time).set("token", token).eq("id", 1);
int r = userInfoDao.update(update);
</pre>
</div>
</div>
<p>插入数据</p>
<div class="white" >
<div class="highlight" >
<pre class="brush: java">UserInfo userInfo = new UserInfo();
userInfo.setId(UUIDUtils.uuid());
userInfo.setToken(token);
userInfo.setChannel(channel);
userInfo.setStatus_at(StatusAt.active.getCode());
userInfo.setClient_version(clientVersion);
userInfo.setCredit(0);
userInfo.setIp(ip);
userInfo.setPhone(phone);
userInfo.setPassword(sourcePwd);
userInfo.setSalt(salt);
userInfo.setCreate_at(now());
userInfo.setUpdate_at(now());
userInfo.setOs(os);
InsertBuilder insert = InsertBuilder.build(UserInfo.class).set(userInfo);
int r = userInfoDao.insert(insert);
</pre>
</div>
</div>
<p>删除数据</p>
<div class="white" >
<div class="highlight" >
<pre class="brush: java">DeleteBuilder delete= DeleteBuilder.build(UserInfo.class).eq("id", 1);
int r = userInfoDao.delete(delete);</pre>
</div>
</div>
```
