```java
private static class ReducerClass extends Reducer<Text, Text, Text, NullWritable> {
    private MultipleOutputs out = null;

    @Override
    protected void setup(Context context) throws IOException, InterruptedException {
        out = new MultipleOutputs(context);
    }

    @Override
    protected void cleanup(Context context) throws IOException, InterruptedException {
        if (null != out) {
            out.close();
        }
    }

    protected void reduce(Text key, Iterable<Text> values, Context context) throws IOException
    InterruptedException {
        out.write(KEY, VALUE, TAG);     // TAG用于输出文件前缀
    }
}
```
