生成4位随机数

```
public static String generateRandom(){
    String fourRandom = "";
    //产生4位的随机数(不足4位前加零)
    int randomNum = (int)(Math.random()*10000);
    fourRandom = randomNum + "";
    int randLength = fourRandom.length();
    if(randLength<4){
        for(int i=1; i<=4-randLength; i++)
            fourRandom = fourRandom + "0";
    }
    return fourRandom;
}
```

通过浏览器进行下载二维码

```
public void downloadQr(RequestContext requestContext, HttpServletResponse response) throws IOException {
    Sign sign = signService.get(requestContext.get("id", String.class));
    String text = "http://www.baidu.com";
    int width = 300;
    int height = 300;
    //二维码的图片格式
    String format = "jpg";
    Hashtable hints = new Hashtable();
    //内容所使用编码
    hints.put(EncodeHintType.CHARACTER_SET, "utf-8");
    BitMatrix bitMatrix = null;
    try {
        bitMatrix = new MultiFormatWriter().encode(text, BarcodeFormat.QR_CODE, width, height, hints);
        //生成二维码
        SimpleDateFormat sf = new SimpleDateFormat("yyyyMMddHHmmss");
        OutputStream out = response.getOutputStream();
        MatrixToImageWriter.writeToStream(bitMatrix, format, out);
        // 创建文件输出流
        response.setContentType("image/jpeg");
        byte buffer[] = new byte[1024];
        // 循环将输入流中的内容读取到缓冲区当中
        int len = 0;
        // 输出缓冲区的内容到浏览器，实现文件下载
        out.write(buffer, 0, len);
        out.close();
    } catch (WriterException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    } catch (IOException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }
}
```

```
}
```

直接在下载到本地磁盘

```
public void downloadQr(RequestContext requestContext, HttpServletResponse response) throws IOException {
    String classLoadPath = SignController.class.getClassLoader().getResource("").getPath();
    String imgPath = classLoadPath + ".jpg";
    // QrCodeWriter.write(sign.getId(), 300, 300, imgPath);
    String format = "jpg";// 二维码的图片格式
    Hashtable<EncodeHintType, String> hints = new Hashtable<EncodeHintType, String>();
    hints.put(EncodeHintType.CHARACTER_SET, "utf-8"); // 内容所使用字符集编码
    String text = "http://www.baidu.com";
    try {
        BitMatrix bitMatrix = new MultiFormatWriter().encode(text, BarcodeFormat.QR_CODE, 300, 300, hints);
        // 生成二维码
        SimpleDateFormat sf = new SimpleDateFormat("yyyyMMddHHmmss");
        String date = sf.format(new Date());
        String generateRandom = generateRandom();
        File outputFile = new File("C:\\\\Users\\\\chun\\\\Downloads" + File.separator + sign.getName() + generateRandom + ".jpg");
        MatrixToImageWriter.writeToFile(bitMatrix, format, outputFile);
        OutputStream out = response.getOutputStream();
        response.reset();
        out.close();
    } catch (WriterException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    } catch (IOException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }
}
```

MatrixToImageWriter

```
package com.zxy.product.train.web.util;
