## React 定义组件的几种方式:

### 一、类继承

#### 1、定义组件

```
import React, {Component} from 'react';

class Header extends Component {
  render() {
    const name = this.props.name;
    return <div>Header{name}div>;
  }
}
export default Header;
```

#### 2、使用组件

```
import React from 'react';
import Header from '../components/header/App';
import Footer from '../components/footer/App';
const App = () => (
  <div className='App'>
    <Header name='text' />
    TEST-XXX
  </div>
);

export default App;
```

### 二、函数式

#### 1、定义组件

```
import React from 'react';
const Footer = () => <div>Hello world.div>;
export default Footer;
```

#### 2、使用组件

```
import React from 'react';
import Footer from '../components/footer/App';
const App = () => (
  <div className='App'>
    TEST-XXX
    <Footer />
  </div>
);

export default App;
```
