一、新建一个配置中心springboot工程

maven配置如下：

```
<?xml version="1.0" encoding="UTF-8"?>

<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>

  <groupId>com.biristone</groupId>
  <artifactId>configure</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <packaging>jar</packaging>

  <name>configure</name>
  <description>biristone</description>

  <parent>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-parent</artifactId>
    <version>2.0.0.RELEASE</version>
    <relativePath/> <!-- lookup parent from repository -->
  </parent>

  <properties>
    <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding>
    <project.reporting.outputEncoding>UTF-8</project.reporting.outputEncoding>
    <java.version>1.8</java.version>
    <spring-cloud.version>Finchley.M8</spring-cloud.version>
    <eureka.version>1.4.0.RELEASE</eureka.version>
  </properties>

  <dependencies>
    <dependency>
      <groupId>org.springframework.cloud</groupId>
      <artifactId>spring-cloud-config-server</artifactId>
    </dependency>

    <dependency>
      <groupId>org.springframework.boot</groupId>
      <artifactId>spring-boot-starter-test</artifactId>
      <scope>test</scope>
    </dependency>

    <dependency>
      <groupId>org.springframework.cloud</groupId>
      <artifactId>spring-cloud-starter-eureka</artifactId>
      <version>${eureka.version}</version>
    </dependency>
    <dependency>
```

```

<groupId>org.tmatesoft.svnkit</groupId>
<artifactId>svnkit</artifactId>
</dependency>
</dependencies>

<dependencyManagement>
<dependencies>
<dependency>
<groupId>org.springframework.cloud</groupId>
<artifactId>spring-cloud-dependencies</artifactId>
<version>${spring-cloud.version}</version>
<type>pom</type>
<scope>import</scope>
</dependency>
</dependencies>
</dependencyManagement>

<build>
<plugins>
<plugin>
<groupId>org.springframework.boot</groupId>
<artifactId>spring-boot-maven-plugin</artifactId>
</plugin>
</plugins>
</build>

<repositories>
<repository>
<id>spring-milestones</id>
<name>Spring Milestones</name>
<url>https://repo.spring.io/milestone</url>
<snapshots>
<enabled>false</enabled>
</snapshots>
</repository>
</repositories>
</project>

```

主程序:

```

package com.biristone;
import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;
import org.springframework.cloud.config.server.EnableConfigServer;

@SpringBootApplication
@EnableConfigServer
public class ConfigureApplication {
public static void main(String[] args) {

```

```
SpringApplication.run(ConfigurableApplicationContext.class, args);
}
}
```

application.yml内容:

```
server:
port: 9527
spring:
application:
name: xxx-service-config
cloud:
config:
server:
svn:
uri: http://192.168.1.111/svn/code/cloude
username: xxx
password: xxx
```

default-label: configsource #http://192.168.1.111/svn/code/cloude/configsource 为配置文件
在路径,如果直接配置为uri是个坑

```
profiles:
active: subversion
```

二、客户端配置springboot配置

maven配置:

```
<?xml version="1.0" encoding="UTF-8"?>

<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/xsd/maven-4.0.0.xsd">
<modelVersion>4.0.0</modelVersion>

<groupId>com.biristone</groupId>
<artifactId>xxxboot</artifactId>
<version>1.0.0</version>
<packaging>jar</packaging>

<name>xxxboot</name>
<description>promotion project for Jmm</description>

<parent>
<groupId>org.springframework.boot</groupId>
<artifactId>spring-boot-starter-parent</artifactId>
```

```
<version>1.5.9.RELEASE</version>
<relativePath/> <!-- lookup parent from repository -->
</parent>

<properties>
    <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding>
    <project.reporting.outputEncoding>UTF-8</project.reporting.outputEncoding>
    <java.version>1.8</java.version>
    <start-class>com.jmm.drools.DroolsSpringbootApplication</start-class>
    <drools.version>6.5.0.Final</drools.version>
    <druid.version>1.1.5</druid.version>
    <druid.starter.version>1.1.5</druid.starter.version>
    <mybatis.version>3.4.1</mybatis.version>
    <mybatis-spring-boot.version>1.1.1</mybatis-spring-boot.version>
    <eureka.version>1.4.0.RELEASE</eureka.version>
    <archaius.version>0.6.1</archaius.version>
</properties>

<dependencies>
    <dependency>
        <groupId>org.springframework.cloud</groupId>
        <artifactId>spring-cloud-starter-eureka</artifactId>
        <version>${eureka.version}</version>
    </dependency>
    <dependency>
        <groupId>com.netflix.archaius</groupId>
        <artifactId>archaius-core</artifactId>
        <version>${archaius.version}</version>
    </dependency>
    <!--Drools-->
    <dependency>
        <groupId>org.kie</groupId>
        <artifactId>kie-api</artifactId>
        <version>${drools.version}</version>
    </dependency>
    <dependency>
        <groupId>org.drools</groupId>
        <artifactId>drools-core</artifactId>
        <version>${drools.version}</version>
    </dependency>
    <dependency>
        <groupId>org.drools</groupId>
        <artifactId>drools-compiler</artifactId>
        <version>${drools.version}</version>
    </dependency>
    <dependency>
        <groupId>org.drools</groupId>
        <artifactId>drools-decisiontables</artifactId>
        <version>${drools.version}</version>
    </dependency>
    <dependency>
        <groupId>org.drools</groupId>
        <artifactId>drools-templates</artifactId>
        <version>${drools.version}</version>
    </dependency>
```

```
</dependency>

<!--SpringBoot core-->
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter</artifactId>
    <exclusions>
        <exclusion>
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-starter-logging</artifactId>
        </exclusion>
    </exclusions>
</dependency>

<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-data-redis</artifactId>
</dependency>

<!--log4j-->

            </executions>
        </plugin>
    </plugins>
</build>

</project>

```

** 需要注意最好一定要配置到bootstrap.yml里,如果没有最好新建一个bootstrap.yml

** 内容如下:

```

spring:
cloud:
config:
uri: http://localhost:9527/
profile: dev

```

** 客户端主程序注入配置中心注解:

```

** package com.birstone.drools;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.boot.SpringApplication;

```

```
import org.springframework.boot.autoconfigure.EnableAutoConfiguration;
import org.springframework.boot.autoconfigure.SpringBootApplication;
import org.springframework.cloud.client.discovery.EnableDiscoveryClient;
import org.springframework.context.annotation.Bean;
import org.springframework.context.annotation.ComponentScan;
import org.springframework.context.annotation.Configuration;
import org.springframework.core.env.Environment;
import org.springframework.scheduling.annotation.EnableScheduling;
import springfox.documentation.builders.PathSelectors;
import springfox.documentation.builders.RequestHandlerSelectors;
import springfox.documentation.spi.DocumentationType;
import springfox.documentation.spring.web.plugins.Docket;
import springfox.documentation.swagger2.annotations.EnableSwagger2;

@SpringBootApplication
@ComponentScan(basePackages = "com.biristone.drools")
@EnableScheduling
@EnableSwagger2
@Configuration
@EnableAutoConfiguration
@EnableDiscoveryClient
public class DroolsSpringbootApplication {

    public static void main(String[] args) {
        SpringApplication.run(DroolsSpringbootApplication.class, args);
    }

    @Bean
    public Docket createRestApi() {
        return new Docket(DocumentationType.SWAGGER_2)
            .select()
            .apis(RequestHandlerSelectors.basePackage("com.jmm.drools.web"))
            .paths(PathSelectors.any())
            .build();
    }

    @Autowired
    void setEnvironment(Environment env) {
        //appname为配置文件里的某个属性名
        System.out.println("+++++++" + env.getProperty("appname"));
    }
}
```

```
}
```

Controller从配置中心读取属性：

```
@Value("${appname}")
private String appname;
@Value("${appvalue}")
private String appvalue;
@ApiOperation(value = "配置信息")
@RequestMapping(value = "/config", method = RequestMethod.POST, produces = "text/html
charset=UTF-8")
public String config() {
return appname+"|"+appvalue;
}
```
