1、数组list

Redis结合fastjson存储

```
List<Home> home = new ArrayList<Home>();  
String key = "redisKey";  
redisUtil.set(key, JSON.toJSONString(home));
```

Redis结合fastjson读取

```
String key = "redisKey";  
Object value = redisUtil.get(key);  
List<Home> home = JSON.parseArray((String)value, Home.class);
```

2、HashMap

Redis结合fastjson存储

```
Map<Integer, List<ItemsToTemplate>> itemMap = new HashMap<Integer, List<ItemsToTe  
plate>>();  
String key = "redisKey";  
redisUtil.set(key, JSON.toJSONString(itemMap));
```

Redis结合fastjson读取

```
String key = "redisKey";  
String value = redisUtil.getStr(key);  
Map<Integer, List<ItemsToTemplate>> itemMap = JSON.parseObject(value, new TypeRefere  
nce<Map<Integer, List<ItemsToTemplate>>>(){}.getType());
```
