题目

Two Sum

Given an array of integers, return **indices** of the two numbers such that they add up to a specific target.

You may assume that each input would have **exactly** one solution, and you may not use the **same** element twice.

Example:

Given `nums = [2, 7, 11, 15]`, `target = 9`,

Because $\text{nums}[0] + \text{nums}[1] = 2 + 7 = 9$,
return `[0, 1]`.

解法

一：暴力搜索

两个for循环即可

二：使用HashMap

思路

for循环数组，从HashMap中查找结果，找到则返回结果，否则将该位放入HashMap

代码

```
class Solution {  
    public int[] twoSum(int[] nums, int target) {  
        HashMap<Integer, Integer> map = new HashMap<>();  
        int[] result = new int[2];  
        map.put(nums[0], 0);  
        for (int i = 1; i < nums.length; i++) {  
            boolean key = map.containsKey(target - nums[i]);  
            if (key) {  
                result[0] = map.get(target - nums[i]);  
                result[1] = i;  
                break;  
            }  
            map.put(nums[i], i);  
        }  
        return result;  
    }  
}
```
