刚刚完成初版, 其中的数据文件路径和数据内容格式还需要仔细核对, 但整体逻辑已实现, 剩下的工时间可能会用来完善它

Anaconda3

The open-source [Anaconda Distribution](#) is the easiest way to perform Python/R data science and machine learning on Linux, Windows, and Mac OS X. With over 11 million users worldwide, it is the industry standard for developing, testing, and training on a single machine, enabling individual data scientists to:

- Quickly download 1,500+ Python/R data science packages
- Manage libraries, dependencies, and environments with [Conda](#)
- Develop and train machine learning and deep learning models with [scikit-learn](#), [TensorFlow](#), and [Theano](#)
- Analyze data with scalability and performance with [Dask](#), [NumPy](#), [pandas](#), and [Numba](#)
- Visualize results with [Matplotlib](#), [Bokeh](#), [Datashader](#), and [Holoviews](#)

python读取xml

```
from xml.dom import minidom
```

```
def readXmlByTagName(path):  
    with open(path, 'r', encoding='utf8') as fh:  
        # 获取根节点  
        root = minidom.parse(fh).documentElement  
        # 节点类型: 'ELEMENT_NODE', 元素节点; 'TEXT_NODE', 文本节点; 'ATTRIBUTE_NODE'
```

```

, 属性节点
    #print('节点类型:')
    return root
def getElementsByTagName(root,tagName):
    return root.getElementsByTagName(tagName)[0].childNodes[0].data

```

DataFrame --- pandas

pandas is an open source, BSD-licensed library providing high-performance, easy-to-use data structures and data analysis tools for the Python programming language.

pandas的使用效果很臃肿，在项目中主要用来读取如下图格式数据：

1	54421, 2222, 2019, 144, 1700, 0, 01, -999.9, 140.992, -999.9, -999.9, -999.9, -999.9, -999.9, -999.9, -999.9, 26.069, 27.303, 34.686, 969.470

用到的pandas语法大概有：

- `pandas.read_table(data_path, sep=',', dtype = 'str')` 用来将数据读取出来
- `.shape[0]`用来获取数据的行数
- `.iloc`根据x和y轴来定位元素

十进制转二进制

```
def Number2BinStr(num, size):
```

```

'''
整形转二进制字符的方法；
:param num: 需要变换的整数；
:param size: 设定二进制宽度
:return:
'''

fmt = '{0:0%db}' % size
return fmt.format(num),size

```

字符串转二进制

```
def encode(s="", size=8):
    str_len = len(s)
    if str_len*8 < size:
        for i in range(0, int((size - str_len*8)/8)):
```

```

    s = s + ' '
elif str_len*8 > size:
    pass
    # s = s
    # for i in range(0, int((str_len*8 - size)/8)):
strs = ""
for c in s:
    str_byte = bin(ord(c)).replace('0b', '')
    b = 8 - len(str_byte)
    for i in range(0, b):
        str_byte = '0'+str_byte
    strs = strs + str_byte
return strs, size

```

求数据乘以比例因子加系数

```

def data_trasform_func(data, x, b):
    """
    求数据乘以比例因子加系数的方法;
    :param data: 数据值;
    :param x:比例因子
    :param b:基准值
    :return:返回转换后的值;
    """
    return int(data*math.pow(10, x) + b)

```

判断某文件夹下是否包含某个名称的文件，仅支持单个词模糊查询

```

#判断是否有数据文件
def search(path=".", name=""):
    result = []
    for item in os.listdir(path):
        item_path = os.path.join(path, item)
        if os.path.isdir(item_path):
            search(item_path, name)
        elif os.path.isfile(item_path):
            if name in item:
                result.append(item_path)
    return result

```
