开头说几句

博主的博客地址：<https://www.jeffcc.top/>

博主学习设计模式用的书是Head First的《设计模式》，强烈推荐配套使用！

什么是命令模式

权威定义：将“请求”封装成对象，以便使用不同的请求、队列或者日志来参数化其他对象。命令模也支持撤销操作。

博主的理解：关注的重点应该在于我们如何将一个个请求（命令）封装成对象，然后适配到命令调用手上，调用者不需要知道具体实现了什么操作，同时实现了将发出请求的对象和接受与执行请求的对象之间的解耦。

设计原则

1. 封装变化
2. 多用组合，少用继承
3. 针对接口编程，不针对实现编程
4. 为交互对象之间的松耦合设计而努力
5. 类应该对拓展开放，对修改关闭
6. 依赖抽象，不依赖具体类

设计要点

1. 命令模式将发出请求的对象和执行请求的对象解耦

- 在被解耦的两者之间是通过命令对象进行沟通的；命令对象封装了一个或者一组的动作
- 调用者通过命令对象的execute()发出请求，这会使得接受者的动作被调用
- 调用者可以接受命令当做参数，甚至可以在运行时动态进行
- 命令可以支持撤销功能，方法是通过实现一个undo方法来回到execute方法执行之前的状态
- 命令模式同时也支持使用宏命令，即无需修改源码来实现完成多个的功能的同时开关

实例设计

设计背景

实现一个多槽家用自动化遥控器，可以通过一个遥控器来实现控制起居室灯、花园洒水器，起居室吊、车库门、音响、所有的灯、舞会模式的开关，以及一些其他的拓展功能（能在不修改源码的前提下实现），同时实现一个撤销功能（撤销上一个实现的命令）以及宏命令功能。

设计想法

通过设置一个命令的统一规范接口来规范化各种命令

然后设置各自命令的具体实现类

适配到遥控器中（通过数组来实现多遥控适配）

项目类图

可以看出所有命令类都实现了接口Command

项目结构

命令类规范化接口

```
package command;

/**
 * 命令的统一接口规范
 * 体现了面向接口编程思想
 */
public interface Command {
    // 调用命令的方法
    void execute();
    // 撤销命令的方法
}
```

```
    void undo();
}
```

设备实际操作类

```
package things;
```

```
/***
 * 所有灯光的实际控制类
 * 通过输出来模拟开关灯
 */
public class AllLight {

    public void on(){
        System.out.println("All light is on!");
    }
    public void off(){
        System.out.println("All light is off!");
    }
}
```

```
package things;
```

```
/***
 * 舞会模式的实际控制类
 * 通过输出来模拟开关舞会模式
 */
public class BallPattern {

    public void on(){
        System.out.println("Ball Pattern is on!");
    }
    public void off(){
        System.out.println("Ball Pattern is off!");
    }
}
```

```
package things;
```

```
/***
 * 车库门的实际控制类
 * 通过输出来模拟开关车库门
 */
public class GarageDoor {

    public void on(){
        System.out.println("Garage Door is on!");
    }
    public void off(){
        System.out.println("Garage Door is off!");
    }
}
```

```
}
```

```
package things;

/**
 * 花园洒水器的实际控制类
 * 通过输出来模拟开关洒水器
 */
public class GardenSprinkler {

    public void on(){
        System.out.println("Garden Sprinkler is on!");
    }
    public void off(){
        System.out.println("Garden Sprinkler is off!");
    }
}
```

```
package things;
```

```
/**
 * 起居室风扇的实际控制类
 * 通过输出来模拟开关以及其他功能那个风扇
 * 这里要实现撤销功能 就必须记录风扇的转速
 */
public class LivingRoomFan {

    public static final int HIGH = 3;
    public static final int MEDIUM = 2;
    public static final int LOW = 1;
    public static final int OFF = 0;
    private int speed;

    public void low() {
        System.out.println("Living Room Fan is on low speed!");
        speed = LOW;
    }

    public void medium() {
        System.out.println("Living Room Fan is on medium speed!");
        speed = MEDIUM;
    }

    public void high() {
        System.out.println("Living Room Fan is on high speed!");
        speed = HIGH;
    }

    public void off() {
        System.out.println("Living Room Fan is off!");
        speed = OFF;
    }
}
```

```
public int getSpeed() {
    return speed;
}
}

package things;

/**
 * 起居室灯光的实际控制类
 * 通过输出来模拟开关灯
 */
public class LivingRoomLight {
    public void on() {
        System.out.println("Living Room light is on!");
    }

    public void off() {
        System.out.println("Living Room light is off!");
    }
}
```

```
package things;

/**
 * 音响的实际控制类
 * 通过输出来模拟音响的开关
 */
public class Stereo {

    public void on(){
        System.out.println("Stereo is on!");
    }

    public void off(){
        System.out.println("Stereo is off!");
    }
}
```

设备命令实现类（体现命令模式的特点）

```
package command.impl.allLight;

import command.Command;
import things.AllLight;

/**
 * 关闭所有灯的命令
 */
public class AllLightOff implements Command {

    // 初始化
```

```
private AllLight allLight;

// 需要传递参数过来才能知道要执行
public AllLightOff(AllLight allLight) {
    this.allLight = allLight;
}

// 执行命令
@Override
public void execute() {
    allLight.off();
}

// 撤销命令
@Override
public void undo() {
    allLight.on();
}
}
```

```
package command.impl.allLight;

import command.Command;
import things.AllLight;

/**
 * 开所有灯的命令
 */
public class AllLightOn implements Command {

    // 初始化
    private AllLight allLight;

    // 需要传递参数过来才能知道要执行
    public AllLightOn(AllLight allLight) {
        this.allLight = allLight;
    }

    // 执行命令
    @Override
    public void execute() {
        allLight.on();
    }

    // 撤销命令
    @Override
    public void undo() {
        allLight.off();
    }
}
```

```
package command.impl.ballPartern;
```

```
import command.Command;
import things.BallPattern;

/**
 * 关闭舞会模式的命令
 */
public class BallParternOff implements Command {

    // 初始化
    private BallPattern ballPattern;

    // 需要传递参数过来才能知道要执行
    public BallParternOff(BallPattern ballPattern) {
        this.ballPattern = ballPattern;
    }

    // 执行命令
    @Override
    public void execute() {
        ballPattern.off();
    }

    // 撤销命令
    @Override
    public void undo() {
        ballPattern.on();
    }
}
```

```
package command.impl.ballPartern;

import command.Command;
import things.BallPattern;

/**
 * 开启舞会模式的命令
 */
public class BallParternOn implements Command {

    // 初始化
    private BallPattern ballPattern;

    // 需要传递参数过来才能知道要执行
    public BallParternOn(BallPattern ballPattern) {
        this.ballPattern = ballPattern;
    }

    // 执行命令
    @Override
    public void execute() {
        ballPattern.on();
    }
}
```

```
// 撤销命令
@Override
public void undo() {
    ballPattern.off();
}
}

package command.impl.garageDoor;

import command.Command;
import things.GarageDoor;

/**
 * 关车库门的命令
 */
public class GarageDoorOff implements Command {

```

```
package command.impl.livingRoomLight;

import command.Command;
import things.LivingRoomLight;

/**
 * 实现起居室灯开的命令
 */
public class LivingRoomLightOn implements Command {
    private LivingRoomLight livingRoomLight;

    public LivingRoomLightOn(LivingRoomLight livingRoomLight) {
        this.livingRoomLight = livingRoomLight;
    }

    @Override
    public void execute() {
        livingRoomLight.on();
    }

    @Override
```

```
public void undo() {
    livingRoomLight.off();
}
}

package command.impl.stereo;

import command.Command;
import things.Stereo;

/**
 * 关闭音响的命令
 */
public class StereoOff implements Command {
    // 初始化
    private Stereo stereo;

    public StereoOff(Stereo stereo) {
        this.stereo = stereo;
    }

    // 执行命令
    @Override
    public void execute() {
        stereo.off();
    }

    // 撤销命令
    @Override
    public void undo() {
        stereo.on();
    }
}
```

```
package command.impl.stereo;

import command.Command;
import things.Stereo;

/**
 * 开音响的命令
 */
public class StereoOn implements Command {
    // 初始化
    private Stereo stereo;

    public StereoOn(Stereo stereo) {
        this.stereo = stereo;
    }

    // 执行命令
    @Override
```

```
public void execute() {
    stereo.on();
}

// 撤销命令
@Override
public void undo() {
    stereo.off();
}
}
```

宏命令类以及空命令类

```
package command.impl;

import command.Command;

/**
 * 宏命令
 */
public class MacroCommand implements Command {
    private Command[] commands;
    private Command[] undoCommands;

    public MacroCommand(Command[] commands) {
        this.commands = commands;
    }

    @Override
    public void execute() {
        // 初始化撤销
        undoCommands = new Command[commands.length];
        for (int i = 0; i < commands.length; i++) {
            commands[i].execute();
            undoCommands[i] = commands[i];
        }
    }

    // 宏撤销
    @Override
    public void undo() {
        for (Command undoCommand : undoCommands) {
            undoCommand.undo();
        }
    }
}

package command.impl;

import command.Command;

/**
```

```

 * 空命令对象 什么都不做
 */
public class NullCommand implements Command {

    @Override
    public void execute() {

    }

    @Override
    public void undo() {

    }
}

```

遥控器类 (关键)

```

package controller;

import command.Command;
import command.impl.NullCommand;

/**
 * 遥控器类
 */
public class RemoteControl {
    // 数组存放命令分别为 开和关的命令数组
    private Command[] onCommands;
    private Command[] offCommands;
    // 撤销命令保存
    private Command undoCommand;

    public RemoteControl() {
        // 为什么是10 因为风扇有三个档位 对应三组的命令 6+3+1宏命令=10
        this.onCommands = new Command[10];
        this.offCommands = new Command[10];
        // 初始化命令 这里需要创建一个空命令对象来让没有命令的按键什么都不做
        Command noCommand = new NullCommand();
        for (int i = 0; i < onCommands.length; i++) {
            onCommands[i] = noCommand;
            offCommands[i] = noCommand;
        }
        // 初始化 撤销命令
        undoCommand = noCommand;
    }

    /**
     * 设置遥控器上的按键命令
     *
     * @param solt    命令所在位置
     * @param onCommand  开命令
     * @param offCommand 关命令
     */
}

```

```
public void setCommand(int slot, Command onCommand, Command offCommand) {  
    onCommands[slot] = onCommand;  
    offCommands[slot] = offCommand;  
}  
  
/**  
 * 控制第几个按钮的开  
 *  
 * @param slot  
 */  
public void onButtonWasPushed(int slot) {  
    onCommands[slot].execute();  
}  
//    记录要撤销的命令  
    undoCommand = onCommands[slot];  
}  
  
/**  
 * 控制第几个按钮的关  
 *  
 * @param slot  
 */  
public void offButtonWasPushed(int slot) {  
    offCommands[slot].execute();  
}  
//    记录要撤销的命令  
    undoCommand = offCommands[slot];  
}  
  
/**  
 * 调用撤销命令  
 */  
public void undoButtonWasPushed(){  
    undoCommand.undo();  
}  
  
/**  
 * 重写toString  
 * 在遥控器重置完成之后输出按钮情况  
 *  
 * @return  
 */  
@Override  
public String toString() {  
    StringBuffer stringBuffer = new StringBuffer();  
    stringBuffer.append("\n----- Remote Control -----\\n");  
    for (int i = 0; i < onCommands.length; i++) {  
        stringBuffer.append("[slot" + i + "] " + onCommands[i].getClass().getName() + " " + o  
fCommands[i].getClass().getName() + "\\n");  
    }  
    return stringBuffer.toString();  
}  
}
```

测试类

```
package test;

remoteControl.setCommand(8,stereoOn,stereoOff);

// 输出初始化信息
System.out.println(remoteControl);

// 初始化完成
// 进行遥控控制

    System.out.println("----- All Light -----");

// 开灯
remoteControl.onButtonWasPushed(0);
// 关灯
remoteControl.offButtonWasPushed(0);
// 撤销关灯 也就是重新开灯
remoteControl.undoButtonWasPushed();
System.out.println("----- Garage Door -----");

remoteControl.onButtonWasPushed(2);
remoteControl.undoButtonWasPushed();
remoteControl.offButtonWasPushed(2);
System.out.println("----- Fan -----");

// 先调到Low档位
remoteControl.onButtonWasPushed(4);
// 调到Medium档位
remoteControl.onButtonWasPushed(5);
// 撤销 就是回到low档位
remoteControl.undoButtonWasPushed();

// 宏命令

// 添加宏命令进入遥控器 一键开启 所有灯光、花园洒水器、音响、起居室灯光
Command macroCommandOn = new MacroCommand(new Command[]{allLightOn, gardenSprinklerOn, stereoOn, livingRoomLightOn});

```

```

        Command macroCommandOff = new MacroCommand(new Command[]{allLightOff, gar
enSprinklerOff, stereoOff, livingRoomLightOff});
        remoteControl.setCommand(9,macroCommandOn,macroCommandOff);

//    重新显示遥控器参数
System.out.println(remoteControl);

//    使用宏命令
System.out.println("----- macroCommand -----");
remoteControl.onButtonWasPushed(9);
//    撤销宏
remoteControl.undoButtonWasPushed();

    }
}

```

分析

实现了通过把命令封装成类来实现的遥控器设置。

命令模式的现实用途

队列请求

想象有一个工作队列，我们在一端不断的添加命令，然后工作队列的线程只需要不断的从队列中取出令并且调用命令的execute()方法，等待这个调用完成，然后将命令对象丢弃掉，再继续循环下去。

那么在这个过程中，我们的工作队列和要进行运行的对象是完全解耦的，工作队列不需要知道运行的对象是什么方法，只需要运行execute()方法就可以了，这一角度也反映了命令模式的特点，将工作执行和调用者的解耦。

日志请求

日志系统需要我们实时记录下系统运行的动作，我们可以在Command接口中在规范新增两个方法store()以及load()方法。我们可以通过在每个命令进行的时候调用store方法保存动作到日志中，当遇到系统死机的情况，就将命令对象重新加载，调用load方法来获取进行的动作，并且成批的进行execute方法的调用以恢复到系统此前的状态。

事务系统

我们的命令模式也可以巧妙地利用在事务系统中，可以通过调用一整群的命令操作，并且要求要么全一起完成，要么没有进行任何操作。
