1.首先找到swoole扩展包的地址：

<https://pecl.php.net/package/swoole>

Summary	Event-driven asynchronous and concurrent networking engine with high performance for PHP.
Maintainers	shen zhe <shenzhe163 at gmail dot com> (developer) [details] Han Tianfeng <mikao dot tenny at gmail dot com> (lead) [details] Qihao ChenCao <twose at qq dot com> (developer) [details]
License	Apache2.0
Description	Event-driven asynchronous and concurrent networking engine with high performance for PHP. <ul style="list-style-type: none">- event-driven- coroutine- asynchronous non-blocking- multi-thread reactor- multi-process worker- multi-protocol- millisecond timer- built-in http/websocket/http2 server- coroutine http/websocket client- coroutine mysql client- coroutine redis client- coroutine read/write file system- coroutine dns lookup- support IPv4/IPv6/UnixSocket/TCP/UDP- support SSL/TLS encrypted transmission

4.4.0	stable	2019-07-06	swoole-4.4.0.tgz (1377.7kB)		[Changelog]
4.3.5	stable	2019-06-14	swoole-4.3.5.tgz (1316.7kB)		[Changelog]
4.3.4	stable	2019-05-17	swoole-4.3.4.tgz (1317.3kB)		[Changelog]
4.3.3	stable	2019-04-20	swoole-4.3.3.tgz (1316.9kB)		[Changelog]
4.3.2	stable	2019-04-15	swoole-4.3.2.tgz (1318.0kB)		[Changelog]
4.3.1	stable	2019-03-13	swoole-4.3.1.tgz (1281.0kB)		[Changelog]
4.3.0	stable	2019-03-06	swoole-4.3.0.tgz (1276.4kB)		[Changelog]
4.2.13	stable	2019-02-02	swoole-4.2.13.tgz (1275.0kB)		[Changelog]

里面有swoole的各种版本，选择一个下载，例如我下载的是最新的4.4.0

执行命令：

```
wget -c https://pecl.php.net/get/swoole-4.4.0.tgz
```

之后，swoole扩展就下载下来了，

2.解压

```
tar -zxvf swoole-4.4.0.tgz
```

3. 目录切换到解压完成的包里面

```
cd swoole-4.4.0
```

4.通过 phpize 建立 php的外挂模块

```
/usr/local/php/bin/phpize
```

5.配置编译安装

```
./configure --with-php-config=/usr/local/php/bin/php-config
```

```
make && make install
```

6. 将扩展extension=swoole.so添加到 /usr/local/php/etc/php.ini 中。

找到你的php.ini所在位置,

```
vim /usr/local/php/etc/php.ini
```

添加extension=swoole.so

7. 重启

```
Inmp restart
```

或者

```
/etc/init.d/php-fpm restart
```

参考以下命令：

PHP-FPM状态管理： /etc/init.d/php-fpm {start|stop|quit|restart|reload|logrotate}

Nginx状态管理： /etc/init.d/nginx {start|stop|reload|restart}

MySQL状态管理： /etc/init.d/mysql {start|stop|restart|reload|force-reload|status}

Memcached状态管理： /etc/init.d/memcached {start|stop|restart}

PureFTPd状态管理： /etc/init.d/pureftpd {start|stop|restart|kill|status}

ProFTPd状态管理： /etc/init.d/proftpd {start|stop|restart|reload}

Redis状态管理： /etc/init.d/redis {start|stop|restart|kill}
