总得说点什么

```
import Foundation
```

```
struct SwiftWrapper<Base> {  
    var base: Base  
    init(_ base: Base) {  
        self.base = base  
    }  
}
```

```
protocol SwiftProtocol {}
```

```
extension SwiftProtocol {
```

```
    var swifter: SwiftWrapper<Self> {  
        return SwiftWrapper(self)  
    }
```

```
    static var swifter: SwiftWrapper<Self>.Type {  
        return SwiftWrapper<Self>.self  
    }  
}
```

```
extension String: SwiftProtocol { }  
extension NSString: SwiftProtocol { }
```

```
extension SwiftWrapper where Base: ExpressibleByStringLiteral {
```

```
var numberCount: Int {
    var count = 0
    for c in (base as! String) where ("0"... "9").contains(c) {
        count += 1
    }
    return count
}

static func print() {
    Swift.print("static func")
}

let string = "243786"
print(string.swifter.numberCount)
String.swifter.print()
```

下面有个小姐姐
