想问问 service 太多依赖怎么办?

一个 service 里面依赖了很多 repository, 大家是怎么处理的? 并且这些都是业务逻辑需要且围绕当主体进行使用的。比如

```
@Service
@RequiredArgsConstructor
public class PlanMaterialServiceImpl extends BaseServiceImpl<PlanMaterialRepository,
    PlanMaterial, Long>
    implements PlanMaterialService {

    private final @NonNull MaterialRepository materialRepository;
    private final @NonNull MaterialTypeRepository materialTypeRepository;
    private final @NonNull PlanMaterialRepository planMaterialRepository;
    private final @NonNull ProcurementPlanRepository procurementPlanRepository;
    private final @NonNull MaterialDemandPlanRepository materialPlanRepository;
    private final @NonNull SysDepartmentRepository sysDepartmentRepository;
    private final @NonNull ApprovalRepository approvalRepository;
    private final @NonNull SysUserRepository sysUserRepository;
    private final @NonNull NotificationRepository notificationRepository;
    private final @NonNull NotifyUtil notifyUtil;
    // .....
}
```

这样他就有 10 个 Repository 需要注入了, 但是主体确实是 **PlanMaterial**。。。大家如何处理这种情况的呢?
