先来张成功的图

前端代码：

html:

```
<form class="layui-form" action="/article/add" method="post" id="articleForm">
  <!-- 文章标题 -->
  <div class="layui-form-item">
    <div class="layui-input-block" style="margin-left: 0px;">
      <input type="text" name="title" lay-verify="title" autocomplete="off" placeholder="
输入文章标题" class="layui-input">
    </div>
  </div>
  <!-- 文章内容 -->
  <div class="layui-form-item layui-form-text">
    <div class="layui-input-block" style="margin-left: 0px;">
      <textarea class="layui-textarea layui-hide" name="content" lay-verify="content" id="articleContent"> </textarea>
    </div>
  </div>
  <!-- 文章标签 -->
  <div class="layui-form-item">
    <div class="layui-input-block" style="margin-left: 0px;">
      <input type="text" name="label" lay-verify="title" autocomplete="off" placeholder="
输入文章标签，用英文逗号隔开。" class="layui-input">
    </div>
  </div>
  <button name="status" value="1" class="layui-btn" lay-submit lay-filter="*">保存到草稿</button>
  <button name="status" value="2" class="layui-btn" lay-submit lay-filter="*">发布</button>
</form>
```

</form>

js:

```
layui.use(['element','layedit','layer','form'], function(){
    var $ = layui.jquery;
    var element = layui.element;
    var layedit = layui.layedit;
    var layer = layui.layer;
    var form = layui.form;

    $("#createArticlePanel").click(function() {
        $.ajax({
            url : '/html/article/add.html',
            type : 'GET',
            success : function(data){
                element.tabAdd('mainPanel', {
                    title: '添加文章',
                    content: data, //
                    id: '10000'
                });
                element.tabChange('mainPanel', '10000');
                layedit.set({
                    uploadImage: {
                        url: '/upload/image' //接口url
                        ,type: 'post' //默认post
                    }
                });
                //注意：layedit.set 一定要放在 build 前面，否则配置全局接口将无效

                layedit.build('articleContent');
            }
        });
    });

});
```

后端用**file**接收，代码：

```
@Controller
@RequestMapping("/upload")
public class FileUploadController {

    @Autowired
    private FileUploadService fileUploadService;

    @RequestMapping(value="/image", method = RequestMethod.POST)
    @ResponseBody
```

```
public String uploadImage(MultipartFile file){  
    FileUploadResult result = fileUploadService.uploadImage(file);  
    return JsonUtils.objectToJson(result);  
}  
}
```

解决了这个好开心

先用这个编辑器，等功能写的差不多了再换 Markdown 编辑器
