Github Actions 是 Github 内置的 CI/CD 工具，现在已经对所有的开源项目免费开放了。

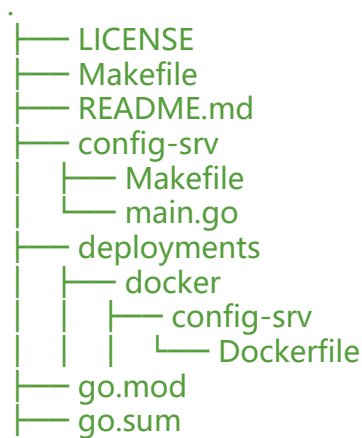

本文主要记录使用 Github Actions 实践 CI/CD 的一些配置。

功能目标

- 代码静态检查
- 代码单元测试
- release/tag 时自动 build 镜像并推送到 docker hub

项目 Dockerfile 和 Makefile

项目主要目录

- config-srv 目录：服务代码
- deployments 目录：所有服务的 Dockerfile
- Makefile 顶层 Makefile：build Docker 镜像

我们先看下顶层的 Makefile

```
.PHONY: config-srv
config-srv:
    docker build -f deployments/docker/config-srv/Dockerfile . -t config-srv
```

我们可以在后面配置的 Github Actions 配置文件中执行 `make config-srv`，这样就会执行 `docker build -f deployments/docker/config-srv/Dockerfile . -t config-srv`，构建一个 docker 镜像。

接下来，看一下 `deployments/docker/config-srv/Dockerfile`，配置 Dockerfile 多阶段构建。

```
FROM golang:1.13-alpine as builder
WORKDIR /root
COPY ./ ./
RUN export GO111MODULE=on && CGO_ENABLED=0 GOOS=linux go build -o build/config-srv config-srv/main.go
```

```
FROM alpine:latest
```

```
RUN apk --no-cache add ca-certificates
WORKDIR /root
COPY --from=builder /root/build/config-srv ./
```

```
ENTRYPOINT ["/root/config-srv"]
```

Github Actions 具体配置

commit 提交自动 CI

```
name: CI
on:
  push:
    branches:
      - master
    paths-ignore:
      - 'README.md'
  pull_request:
    branches:
      - master
    paths-ignore:
      - 'README.md'
jobs:
  lint: # 使用golanci-lint 进行静态检查
    name: Lint
    runs-on: ubuntu-latest
    steps:
      - name: Set up Go 1.13
        uses: actions/setup-go@v1
        with:
          go-version: 1.13
      - id: go
      - name: Code
        uses: actions/checkout@v1
      - name: Install Golangci-lint
        run: curl -sL https://raw.githubusercontent.com/golangci/golangci-lint/master/install.sh |
h -s -- -b . latest
      - name: Lint
        run: ./golangci-lint run --skip-dirs=".git|.github|dashboard|doc" --timeout=5m

test:
  name: Unit Testing # go test
  runs-on: ${{ matrix.os }}
  strategy:
    matrix:
      os: [ubuntu-latest] # 选择系统类型
  steps:
    - name: Set up Go 1.13
      uses: actions/setup-go@v1
      with:
        go-version: 1.13
    - id: go
    - name: Code
```

```
uses: actions/checkout@v1
- name: Go Get dependencies
  run: go get -v -t -d ./...
- name: Go Test
  run: go test -v ./...
```

release/tag 时自动 CI/CD

```
name: Release
on: # 限定在 master 分支 release 操作时触发
  release:
    types: [published]
    branches:
      - master
jobs:
  lint: # 静态检查
    name: Lint
    runs-on: ubuntu-latest
    steps:
      - name: Set up Go 1.13
        uses: actions/setup-go@v1
        with:
          go-version: 1.13
      - name: Code
        uses: actions/checkout@v1
      - name: Intsall Golangci-lint
        run: curl -sfL https://raw.githubusercontent.com/golangci/golangci-lint/master/install.sh|
sh -s -- -b . latest
      - name: Lint
        run: ./golangci-lint run --skip-dirs=".git|.github|dashboard|doc" --timeout=5m

  test:
    name: Unit Testing # 单元测试
    runs-on: ${ matrix.os }
    strategy:
      matrix:
        os: [ubuntu-latest]
    steps:
      - name: Set up Go 1.13
        uses: actions/setup-go@v1
        with:
          go-version: 1.13
      - name: Code
        uses: actions/checkout@v1
      - name: Go Get dependencies
        run: go get -v -t -d ./...
      - name: Go Test
        run: go test -v ./...

  docker: # build docker 镜像并且推送
    needs: [lint, test]
    name: docker build and push
```

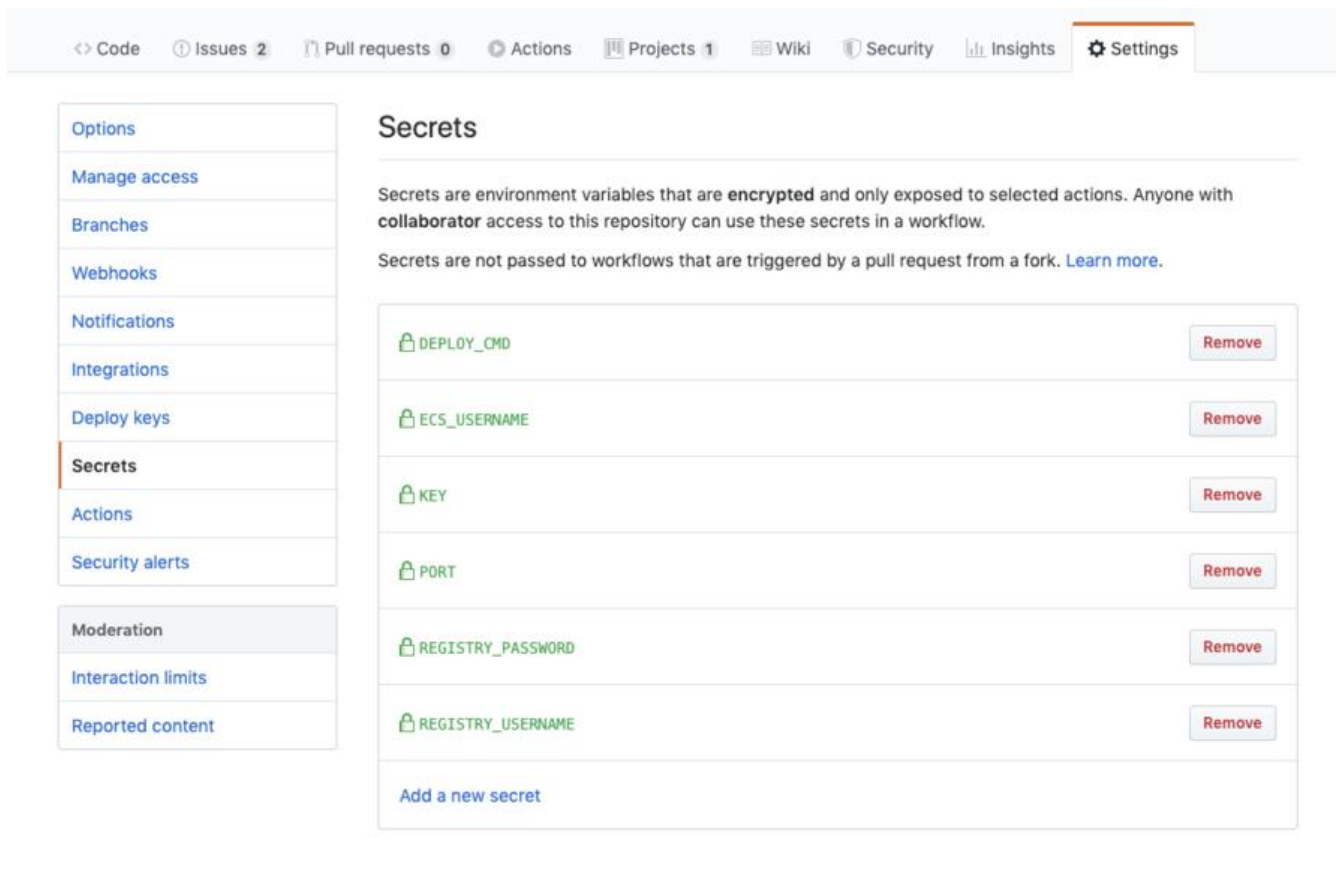

```

runs-on: ubuntu-latest
steps:
  - name: Code
    uses: actions/checkout@v1
  - name: Set env
    run: echo ::set-env name=RELEASE_VERSION::$(echo ${GITHUB_REF:10}) # 取tag名称,
面作为 docker 的 tag
  - name: tag
    run: echo ${ env.RELEASE_VERSION }
  - name: config-srv # 执行代码仓库中的 Makefile , 在 Makefile 中执行 docker build 操作
    run: |
      make config-srv
      docker login docker.io -u ${ secrets.REGISTRY_USERNAME } -p ${ secrets.REGISTRY_P
SSWORD }
      docker tag config-srv:latest ${ secrets.REGISTRY_USERNAME }/config-srv:latest
      docker tag config-srv:latest ${ secrets.REGISTRY_USERNAME }/config-srv:${ env.RELE
SE_VERSION }

      docker push ${ secrets.REGISTRY_USERNAME }/config-srv:latest
      docker push ${ secrets.REGISTRY_USERNAME }/config-srv:${ env.RELEASE_VERSION }

```

上述的 `${ secrets.REGISTRY_USERNAME }` 等环境变量, 皆在 Github - settings - secrets 中设。登陆 docker hub 所需要的账号密码或者其他敏感信息都在此设置, 避免明文写在 yaml 中。

在 Github 的项目仓库顶层 `.github/workflows` 文件夹放置两个 yml 文件即可。每次 commit 提交会触发 `ci.yml` 中的配置逻辑, 当 release 发布时就会触发 `release.yml` 中的配置逻辑。

`.github`

workflows
ci.yml
release.yml

1 directory, 2 files

触发的 pipeline 可以在项目主页 Tab 栏点击 Actions 查看。

The image shows two screenshots of the GitHub Actions interface. The top screenshot displays the 'All workflows' page, listing several workflow runs with their status (green checkmarks), names, and completion times. The bottom screenshot shows a detailed view of a workflow run for 'Merge pull request #17 from micro-in-cn/fix fix Specifi...', highlighting the 'docker build and push' job. The job log shows the execution of 'make micro' and 'docker build' commands, indicating a successful build and push of Docker images.

本文 Makefile , Dockefile , CI 配置都节取自 [XConf](#) 项目, 可以去仓库查看完整配置。

相关实践项目

- [XConf](#): 基于 go-micro 构建的分布式配置中心。
- [Gev](#): 一个轻量、快速的基于 Reactor 模式的非阻塞 Golang TCP 网络库, 支持自定义协议, 轻松搭建高性能服务器。
