# 1. 部署前准备

## 1.1 服务器信息

主机名	IP 地址	相关服务和角色
node01 ipvsadm	10.40.96.4	keepalived
node02 ipvsadm	10.40.96.5	keepalived
node03 + fastdfs Tracker	10.40.96.6	Nginx cache
node04 + fastdfs Tracker	10.40.96.7	Nginx cache
node05 dfs-nginx-module + fastdfs Storage	10.40.96.8	Group1/fastdfs
node06 dfs-nginx-module + fastdfs Storage	10.40.96.9	Group1/fastdfs
node07 tdfs-nginx-module + fastdfs Storage	10.40.96.10	Group2/fastdfs
node08 tdfs-nginx-module + fastdfs Storage	10.40.96.11	Group2/fastdfs
--	10.40.96.30	VIP

## 1.2 集群架构图

## 1.3 下载源文件到对应节点

源文件	存放节点
tengine-2.2.3.tar.gz	node01 - node08
ngx_cache_purge-2.3.tar.gz	node03、node04
FastDFS_v5.08.tar.gz	node03 - node08
libfastcommon-master.zip	node03 - node08
fastdfs-nginx-module_v1.16.tar.gz de08	node05 - node08

# 2. 编译安装服务

## 2.1 安装 FastDFS

在 node03 - node08 节点上编译安装 fastdfs，执行如下脚本

```
#!/bin/bash
# @Author zhanjie.me
# @email i@zhanjie.me
set -e

# 设置源文件存放目录
src_dir=/usr/local/src
# 安装make、cmake 和 gcc 编译器
yum install -y make cmake gcc gcc-c++

# 安装FastDFS核心库
cd $src_dir && \
unzip libfastcommon-master.zip && \
cd libfastcommon-master && \
./make.sh && \
./make.sh install

# 为fastdfs主程序引用库文件
ln -s /usr/lib64/libfastcommon.so /usr/local/lib/libfastcommon.so || true
ln -s /usr/lib64/libfastcommon.so /usr/lib/libfastcommon.so || true
ln -s /usr/lib64/libfdfclient.so /usr/local/lib/libfdfclient.so || true
ln -s /usr/lib64/libfdfclient.so /usr/lib/libfdfclient.so || true

# FastDFS主程序安装
cd $src_dir && \
tar zxf FastDFS_v5.08.tar.gz && \
cd FastDFS && \
./make.sh && \
./make.sh install

echo "=====Install Success!====="
```

## 2.1.1 分发执行脚本

```
for ((i=3;i<9;i++));do rsync -avzP fastDFS_install.sh root@node0${i}:~/ ;done
for ((i=3;i<9;i++));do ssh root@node0${i} bash /root/fastDFS_install.sh ;done
```

## 2.2 安装 tengine

我们在此处使用 tengine 代替原版 nginx

在 node03、node04 上扩展 ngx\_cache\_purge 安装 tengine

在 node05 - node08 上扩展 fastdfs-nginx-module、ngx\_cache\_purge 安装 tengine

执行脚本如下

```
#!/bin/bash
# @Author zhanjie.me
```

```

# @email i@zhanjie.me
set -e
name=`basename $0`
# 设置源文件存放目录
src_dir=/usr/local/src

case $1 in
0)
echo 0
cd $src_dir && \
tar zxf tengine-2.2.3.tar.gz
configure_command="./configure --prefix=/usr/local/tengine"
;;
1)
echo 1
cd $src_dir && \
tar zxf tengine-2.2.3.tar.gz && \
tar zxf ngx_cache_purge-2.3.tar.gz
configure_command="./configure --prefix=/usr/local/tengine --add-module=${src_dir}/ng
_cache_purge-2.3"
;;
2)
echo 2
cd $src_dir && \
tar zxf tengine-2.2.3.tar.gz && \
tar zxf ngx_cache_purge-2.3.tar.gz && \
tar zxf fastdfs-nginx-module_v1.16.tar.gz && \
sed -i "s#/usr/local/include#/usr/include#g" fastdfs-nginx-module/src/config && \
mkdir -p /etc/fdfs && \
cp fastdfs-nginx-module/src/mod_fastdfs.conf /etc/fdfs
configure_command="./configure --prefix=/usr/local/tengine --add-module=${src_dir}/ng
_cache_purge-2.3 --add-module=${src_dir}/fastdfs-nginx-module/src"
;;
*)
echo "Usage: bash $name [0|1|2]"
exit 1
;;
esac

# 安装make、cmake 和 gcc 编译器
yum install -y make cmake gcc gcc-c++
# 安装依赖
yum install -y pcre-devel openssl-devel

# 编译安装tengine
cd ${src_dir}/tengine-2.2.3 && \
bash -c \
"$configure_command && make && make install"

# 注入启动文件
cat > /usr/lib/systemd/system/tengine.service << EOF
[Unit]
Description=The nginx HTTP and reverse proxy server
After=syslog.target network.target remote-fs.target nss-lookup.target

```

```
[Service]
Type=forking
PIDFile=/usr/local/tengine/logs/nginx.pid
ExecStartPre=/usr/local/tengine/sbin/nginx -t
ExecStart=/usr/local/tengine/sbin/nginx -c /usr/local/tengine/conf/nginx.conf
ExecReload=/bin/kill -s HUP $MAINPID
ExecStop=/bin/kill -s QUIT $MAINPID
PrivateTmp=true

[Install]
WantedBy=multi-user.target
EOF
systemctl daemon-reload

echo "=====Install Success=====
```

## 2.2.1 分发执行脚本

```
for ((i=3;i<9;i++)); do rsync -avzP tengine_install.sh root@node0${i}:~/ ;done
```

针对 node03、node04 节点执行：

```
for ((i=3;i<5;i++)); do ssh root@node0${i} bash /root/tengine_install.sh 1 ;done
```

针对 node05 - node08 节点执行：

```
for ((i=5;i<9;i++)); do ssh root@node0${i} bash /root/tengine_install.sh 2 ;done
```

## 2.3 安装 keepalived

在 node01、node02 上安装 keepalived、ipvsadm

```
yum install -y keepalived ipvsadm
```

## 3. 配置服务

### 3.1 配置 fastdfs-tracker 服务

分别在 node03、node04 节点上执行如下操作

创建 base\_path 目录

```
[root@node03 ~]# mkdir /var/data/fastdfs-tracker
```

生成配置文件

```
[root@node03 ~]# cd /etc/fdfs/
[root@node03 fdfs]# ls
client.conf.sample storage.conf.sample tracker.conf.sample
[root@node03 fdfs]# cp tracker.conf.sample tracker.conf
```

修改 base\_url 路径

```
[root@node03 fdfs]# vim tracker.conf  
...  
# the base path to store data and log files  
base_path=/var/data/fastdfs-tracker  
...
```

设置服务开机启动

```
[root@node03 ~]# systemctl enable fdfs_trackerd.service
```

启动服务

```
[root@node03 ~]# systemctl start fdfs_trackerd  
[root@node03 ~]# systemctl status fdfs_trackerd.service
```

## 3.2 配置 fastdfs-storage 服务

分别在 node05-node08 节点上执行如下操作

创建 base\_path 目录

```
mkdir -p /var/data/fastdfs-storage/base
```

创建 store\_path0 目录

```
mkdir -p /var/data/fastdfs-storage/store
```

生成配置文件

```
[root@node05 ~]# cd /etc/fdfs/  
[root@node05 fdfs]# cp storage.conf.sample storage.conf
```

修改 group\_name,base\_path, store\_path0 和 tracker\_server

```
[root@node05 fdfs]# vim storage.conf  
...  
group_name=group1 #在node07、node08上为group2  
base_path=/var/data/fastdfs-storage/base  
store_path0=/var/data/fastdfs-storage/store  
tracker_server=10.40.96.6:22122  
tracker_server=10.40.96.7:22122  
# the port of the web server on this storage server  
http.server_port=80  
...
```

为 store\_path0 生成虚拟目录 M00

```
ln -s /var/data/fastdfs-storage/store/data /var/data/fastdfs-storage/store/data/M00
```

设置服务开机启动

```
[root@node05 ~]# systemctl enable fdfs_storaged.service
```

启动服务

```
[root@node05 fdfs]# systemctl start fdfs_storaged  
[root@node05 fdfs]# systemctl status fdfs_storaged
```

### 3.3 配置 fastdfs-storage 节点上的 nginx (tengine) 服务

在 node05-node08 节点上执行如下操作

生成 http.conf 配置文件

```
cp /usr/local/src/FastDFS/conf/http.conf /etc/fdfs/
```

生成 mime.types 配置文件

```
cp /usr/local/src/FastDFS/conf/mime.types /etc/fdfs/
```

生成 fastdfs-nginx-module 的配置文件

```
cp /usr/local/src/fastdfs-nginx-module/src/mod_fastdfs.conf /etc/fdfs
```

修改配置文件

```
vim /etc/fdfs/mod_fastdfs.conf
```

```
...  
connect_timeout=10  
#node05、node06 对应 group 1  
#node07、node08 对应 group 2  
group_name=group1/2  
group_count = 2  
tracker_server=10.40.96.6:22122  
tracker_server=10.40.96.7:22122  
url_have_group_name = true  
[group1]  
group_name=group1  
storage_server_port=23000  
store_path_count=1  
store_path0=/var/data/fastdfs-storage/store  
[group2]  
group_name=group2  
storage_server_port=23000  
store_path_count=1  
store_path0=/var/data/fastdfs-storage/store
```

修改 nginx (tengine) 配置文件

```
listen 80;  
  
location ~ /group([0-9])/M00 {  
    add_header Content-Disposition "attachment;filename=$arg_atname";  
    ngx_fastdfs_module;  
}
```

配置开机启动并启动服务

```
systemctl enable tengine
```

```
systemctl start tengine
```

## 3.4 配置 fastdfs-tracker 节点上的 nginx (tengine) 服务

创建缓存目录

```
mkdir -p /var/data/cache/nginx/proxy_cache
```

修改 nginx.conf 文件

```
http {
    include mime.types;
    default_type application/octet-stream;

    log_format main '$remote_addr - $remote_user [$time_local] "$request" '
                    '$status $body_bytes_sent "$http_referer" '
                    '"$http_user_agent" "$http_x_forwarded_for"';

    access_log /var/log/nginx/access.log main;

    sendfile on;

    keepalive_timeout 65;

    #设置缓存
    server_names_hash_bucket_size 128;
    client_header_buffer_size 32k;
    large_client_header_buffers 4 32k;
    client_max_body_size 300m;

    proxy_redirect off;
    proxy_set_header Host $http_host;
    proxy_set_header X-Real-IP $remote_addr;
    proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;
    proxy_connect_timeout 90;
    proxy_send_timeout 90;
    proxy_read_timeout 90;
    proxy_buffer_size 16k;
    proxy_buffers 4 64k;
    proxy_busy_buffers_size 128k;
    proxy_temp_file_write_size 128k;
    #设置缓存存储路径、存储方式、分配内存大小、磁盘最大空间、缓存期限
    #levels=1:2 表示缓存文件有两级目录 1表示第一级目录名为1位数， 2表示第二级目录名为2位数
    proxy_cache_path /var/data/cache/nginx/proxy_cache levels=1:2
    #keys_zone 缓存区域名字，分配200m空间，最大缓存1g,有效期30天
    keys_zone=http-cache:200m max_size=1g inactive=30d;

    proxy_temp_path /var/data/cache/nginx/proxy_cache/tmp;

    #设置 group1 的服务器
    upstream fdbs_group1 {
        server 10.40.96.8:80 weight=1 max_fails=2 fail_timeout=30s;
        server 10.40.96.9:80 weight=1 max_fails=2 fail_timeout=30s;
    }
```

```

#设置 group2 的服务器
upstream fdbs_group2 {
    server 10.40.96.10:80 weight=1 max_fails=2 fail_timeout=30s;
    server 10.40.96.11:80 weight=1 max_fails=2 fail_timeout=30s;
}

server {
    listen 80;
    #charset koi8-r;
    #access_log logs/host.access.log main;
    #access_log "pipe:rollback logs/host.access_log interval=1d baknum=7 maxsize=2G" m
in;
    server_name localhost;
    location /group1/M00 {
        proxy_next_upstream http_502 http_504 error timeout invalid_header;
        proxy_cache http-cache;
        proxy_cache_valid 200 304 12h;
        proxy_cache_key $uri$is_args$args;
        proxy_pass http://fdbs_group1;
        expires 30d;
    }

    location /group2/M00 {
        proxy_next_upstream http_502 http_504 error timeout invalid_header;
        proxy_cache http-cache;
        proxy_cache_valid 200 304 12h;
        proxy_cache_key $uri$is_args$args;
        proxy_pass http://fdbs_group2;
        expires 30d;
    }

    #设置清除缓存的访问权限
    location ~/purge(/.*) {
        allow 127.0.0.1;
        allow 10.40.96.0/20;
        deny all;
        proxy_cache_purge http-cache $1$is_args$args;
    }
}
}

```

配置开机启动并启动服务

```
systemctl enable tengine
systemctl start tengine
```

## 3.5 配置 keepalived 服务

在 node01、node02 上执行如下操作

开启网络转发

```
# open ip_forward
```

```
echo "1" > /proc/sys/net/ipv4/ip_forward
# edit sysctl.conf
vi /etc/sysctl.conf
net.ipv4.ip_forward = 1
sysctl -p
```

修改 keepalived.conf

node01 节点：

```
! Configuration File for keepalived

global_defs {
    ## keepalived 自带的邮件提醒需要开启 sendmail 服务。建议用独立的监控或第三方 SMTP
    router_id node01 ## 标识本节点的字符串，通常为 hostname
}

## 定义虚拟路由，VI_1 为虚拟路由的标示符，自己定义名称
vrrp_instance VI_1 {
    state MASTER ## 主节点为 MASTER，对应的备份节点为 BACKUP
    interface eth1 ## 绑定虚拟 IP 的网络接口，与本机 IP 地址所在的网络接口相同，我的是 eth1
    virtual_router_id 96 ## 虚拟路由的 ID 号，两个节点设置必须一样，可选 IP 最后一段使用，相同的 VRID 为一个组，他将决定多播的 MAC 地址
    mcast_src_ip 10.40.96.4 ## 本机 IP 地址
    priority 100 ## 节点优先级，值范围 0-254，MASTER 要比BACKUP 高
    nopreempt ## nopreempt 解决异常恢复后再次抢占的问题
    advert_int 1 ## 组播信息发送间隔，两个节点设置必须一样，默认 1s
    ## 设置验证信息，两个节点必须一致
    authentication {
        auth_type PASS
        auth_pass zhanjie.me
    }

    ## 虚拟 IP 池，两个节点设置必须一样
    virtual_ipaddress {
        10.40.96.30/20 dev eth1 label eth1:1
    }
}

## 定义lvs
virtual_server 10.40.96.30 80 {
    delay_loop 6      #(每隔6秒查询realserver状态)
    lb_algo wlc      #(lvs 算法)
    lb_kind DR       #(Direct Route)
    persistence_timeout 60  #(同一IP的连接60秒内被分配到同一台realserver)
    protocol TCP      #(用TCP协议检查realserver状态)
    real_server 10.40.96.6 80 {
        weight 100      #(权重)
        TCP_CHECK {
            connect_timeout 10  #(10秒无响应超时)
            delay_before_retry 3
            connect_port 80
        }
    }
    real_server 10.40.96.7 80 {
        weight 100      #(权重)
    }
}
```

```

TCP_CHECK {
    connect_timeout 10 #(10秒无响应超时)
    delay_before_retry 3
    connect_port 80
}
}
}

```

node02 节点:

! Configuration File for keepalived

```

global_defs {
    ## keepalived 自带的邮件提醒需要开启 sendmail 服务。建议用独立的监控或第三方 SMTP
    router_id node02 ## 标识本节点的字串，通常为 hostname
}

## 定义虚拟路由，VI_1 为虚拟路由的标示符，自己定义名称
vrrp_instance VI_1 {
    state BACKUP ## 主节点为 MASTER，对应的备份节点为 BACKUP
    interface eth1 ## 绑定虚拟 IP 的网络接口，与本机 IP 地址所在的网络接口相同，我的是 eth1
    virtual_router_id 96 ## 虚拟路由的 ID 号，两个节点设置必须一样，可选 IP 最后一段使用，相
    的 VRID 为一个组，他将决定多播的 MAC 地址
    mcast_src_ip 10.40.96.5 ## 本机 IP 地址
    priority 90 ## 节点优先级，值范围 0-254，MASTER 要比BACKUP 高
    nopreempt ## nopreempt 解决异常恢复后再次抢占的问题
    advert_int 1 ## 组播信息发送间隔，两个节点设置必须一样，默认 1s
    ## 设置验证信息，两个节点必须一致
    authentication {
        auth_type PASS
        auth_pass zhanjie.me
    }

    ## 虚拟 IP 池，两个节点设置必须一样
    virtual_ipaddress {
        10.40.96.30/20 dev eth1 label eth1:1
    }
}

## 定义lvs
virtual_server 10.40.96.30 80 {
    delay_loop 6          #(每隔6秒查询realserver状态)
    lb_algo wlc          #(lvs 算法)
    lb_kind DR            #(Direct Route)
    persistence_timeout 60 #(同一IP的连接60秒内被分配到同一台realserver)
    protocol TCP          #(用TCP协议检查realserver状态)
    real_server 10.40.96.6 80 {
        weight 100        #(权重)
        TCP_CHECK {
            connect_timeout 10 #(10秒无响应超时)
            delay_before_retry 3
            connect_port 80
        }
    }
    real_server 10.40.96.7 80 {
        weight 100        #(权重)
    }
}
```

```
TCP_CHECK {
    connect_timeout 10 #(10秒无响应超时)
    delay_before_retry 3
    connect_port 80
}
}
```

配置 keepalived 开机启动，并启动服务

```
systemctl enable keepalived.service
systemctl start keepalived.service
```

## 3.6 配置 lvs\_real-server

在 node03、node04 上执行如下操作

为 lo0 网卡加类型配置

```
echo "TYPE=Loopback" >> /etc/sysconfig/network-scripts/ifcfg-lo
```

新建 lvs\_reald 服务

```
[root@node03 ~]# vim /etc/init.d/lvs_reald
#!/bin/bash
### BEGIN INIT INFO
# Provides:
# Default-Start: 2 3 4 5
# Default-Stop: 0 1 6
# Short-Description: Start realserver
# Description: Start realserver
### END INIT INFO

# change the VIP to proper value
VIP=10.40.96.30

case "$1" in
  start)

    echo "Start REAL Server"
    /sbin/ifconfig lo:0 $VIP broadcast $VIP netmask 255.255.255.255 up
    echo "1" >/proc/sys/net/ipv4/conf/lo/arp_ignore
    echo "2" >/proc/sys/net/ipv4/conf/lo/arp_announce
    echo "1" >/proc/sys/net/ipv4/conf/all/arp_ignore
    echo "2" >/proc/sys/net/ipv4/conf/all/arp_announce

  ;;

  stop)

    /sbin/ifconfig lo:0 down
    echo "Stop REAL Server"
    echo "0" >/proc/sys/net/ipv4/conf/lo/arp_ignore
    echo "0" >/proc/sys/net/ipv4/conf/lo/arp_announce
```

```
echo "0" >/proc/sys/net/ipv4/conf/all/arp_ignore
echo "0" >/proc/sys/net/ipv4/conf/all/arp_announce
::
restart)

$0 stop
$0 start

::
*)

echo "Usage: $0 {start|stop}"
exit 1

::
esac

exit 0
```

[root@node03 ~]# chmod a+x /etc/init.d/lvs\_reald

配置开机启动并启动服务

```
chkconfig lvs_reald on
service lvs_reald start
```
