## web.xml中配置

```
<!-- token filter-->
<filter>
  <filter-name>tokenFilter</filter-name>
  <filter-class>com.zpkj.template.filter.TokenFilter</filter-class>
  <init-param>
    <param-name>ignores</param-name>
    <param-value>/app/register,/app/login</param-value>
  </init-param>
</filter>
<filter-mapping>
  <filter-name>tokenFilter</filter-name>
  <url-pattern>/app/*</url-pattern>
</filter-mapping>
```

## Filter实现类中代码

```
public class TokenFilter implements Filter {
  private String excludedPage;
  private String[] excludedPages;

  @Override
  public void init(FilterConfig filterConfig) throws ServletException {
    excludedPage = filterConfig.getInitParameter("ignores");//此处的ignores就是在web.xml
    义的名称一样。
    if (excludedPage != null && excludedPage.length() > 0){
      excludedPages = excludedPage.split(",");
    }
  }

  @Override
  public void doFilter(ServletRequest servletRequest, ServletResponse servletResponse, Filter
  chain) throws IOException, ServletException {
    HttpServletRequest request = (HttpServletRequest) servletRequest;
    HttpServletResponse response = (HttpServletResponse) servletResponse;

    // 定义表示变量 并验证用户请求URL 是否包含不过滤路径
    boolean flag = false;
    for (String page:excludedPages) {
      if (request.getRequestURI().equals(page)){
        flag = true;
      }
    }
    if(flag){
      chain.doFilter(request,response);
    }
  }
}
```

```
@Override
public void destroy() {
}
}
```
